

Mid-term presentation | 18 May 2026

Dominique-Claire Bruttel

In the +Colabor module, I am working with Alina on code snippets that are to be visualised using P5Live. At the start of the module, we familiarised ourselves with various tools (P5Live, Hydra, VCV Rack and Studel) and experimented with them. The main aim was to try out the web application and get to grips with the different syntaxes of the tools.

After an initial introduction to live coding, we discussed our project on Tuesday, 12 May 2026. Together, we brainstormed and decided who would take on which parts of the project and where each of our interests lay. Alina was already very interested in drum & bass and the history behind it. So we decided to carry out a project in this area. Alina was very interested in the audio side, whereas I saw my interests more in the visual area. This meant we complemented each other perfectly and already had a division of labour. For the interim presentation, we agreed that we would both experiment within our respective areas. By the end of the module, we aim to produce one or more codes on the theme of drum & bass. These should also explore the history behind the music and highlight the social issues that are often pushed into the background today.

Before I started coding, I looked for inspiration on Pinterest, YouTube and so on. It was clear to me that I should focus on P5Live, as I've found this tool the easiest to get to grips with so far. I'd already been introduced to various programming languages during my training as a media technician, but I'd never really worked with JavaScript. I don't find JS particularly easy to understand, and consequently I find writing the code difficult too. In class, 'with the lecturers' guidance', I was able to understand it quite well. However, implementing it on my own is a challenge for me. That's why I also sought support from AI for some of the code. I'm looking forward to the second part of the module as well as further coaching sessions with the lecturers to receive personalised support and continue learning.

Below is a brief explanation of the code snippets:

1. Rotating rectangles → an exciting visualisation created by the overlapping of different layers
2. Text D'n'B → text reacts to input from the microphone (lows & highs); Hydra breaks up the static text and creates a fluid movement
3. Arrows follow → clicking the mouse generates new arrows, which move across the screen and follow the existing ones.
