

final presentation | 1st June 2026

Dominique-Claire Bruttel

Already during the intermediate presentation, Alina and I decided on the topic of Drum & Bass, which we also want to focus on in our final presentation. Regarding the division of labor, we initially proceeded as planned: Alina is taking care of the audio, while I am handling the visuals.

After the intermediate presentation, I decided to work with the flocking algorithm. I found this highly exciting because it addresses the community aspect between the history of Drum & Bass and the live-coding community. In the beginning, I tried to understand the code on a deeper level, as I had learned it through a tutorial. However, it was challenging to fully comprehend and modify the code in a way that produced visible changes. Yann then introduced us to the flocking algorithm and further explained the simple ways available to adapt it. Following that, I attempted to replace the triangles with typography. Initially, these were just words, but later we came up with the idea of using other glyphs, such as emojis. I also added an input field where the words do not have to be hardcoded but can instead be added by third parties via the UI.

Additionally, we attempted to make the entire code audio-reactive, so that different elements react differently to the music. Since the code was very complex for me (I had never heard of "flocking" before this module), it was difficult to implement the adjustments for audio-reactivity on my own. Therefore, I used Claude AI for support and learned how prompts need to be formulated to achieve the desired result. During the final week, a lot of self-studies was required alongside the coaching sessions with Yann, and we were not on-site. As a result, the interactivity and behavior could not be tested with the final, definitive inputs. It was therefore a bit of a lottery whether the code would ultimately look like what we had tested or perhaps completely different – which is exactly what happened to me during the intermediate presentation. Furthermore, Alina and I had to refine our concept once more at the very end, as we had both been working on different topics over the previous weeks. Since essentially only the last week could be used for the final work, the whole process turned into a "last-minute action" in the end.

Next time, I would try to conduct somewhat broader experiments, but the time was a bit too short for that. Likewise, I was unable to familiarize myself with JavaScript as deeply as I would have liked. I would have appreciated it if there had been smaller, incremental tasks to learn the programming language, provided that the focus is not meant to be primarily on AI.
